Deliverable 1.1

I was recently contacted by a real estate brokerage that I used to work for to develop some software for them. They have been running into a problem with all the legal documents they need to fill out on a regular basis. When filling out the documents a large portion of the content is identical regardless of who it is being used for, with only a few select fields changing each time; it is also very time consuming for them to browse through the document while filling it out. We will be creating software that will ask the user which document they need to fill out, then present the user with a form requesting only the information that is variable between uses of the form. The software will then give the user a filled out document, with all the static fields filled in and the variable fields filled in with the user provided entries. This will allow real estate agents using the software to extremely efficiently create documents, saving them large amounts of time that they can then use to focus on serving their customers.
